Miriah Meyer

# Outline

- Introduction of Cosmic Rays and Extensive Air Showers
- Telescope Array (TA) Cosmic Ray Observatory
  - Indirection Detection of Cosmic Rays
  - Deployment of TAx4, the Expansion of TA
- Fluorescence Detection Event Reconstruction
- Weather Classification using Machine Learning
- Event Simulation (Monte Carlo)
  - Detector Aperture Calculation
  - Data/MC Comparisons
- TAx4 Preliminary Cosmic Ray Spectrum
- Monocular Combined Cosmic Ray Spectrum
  - Observation of the GZK Suppression

# Introduction of Cosmic Rays and Extensive Air Showers

# Cosmic Rays

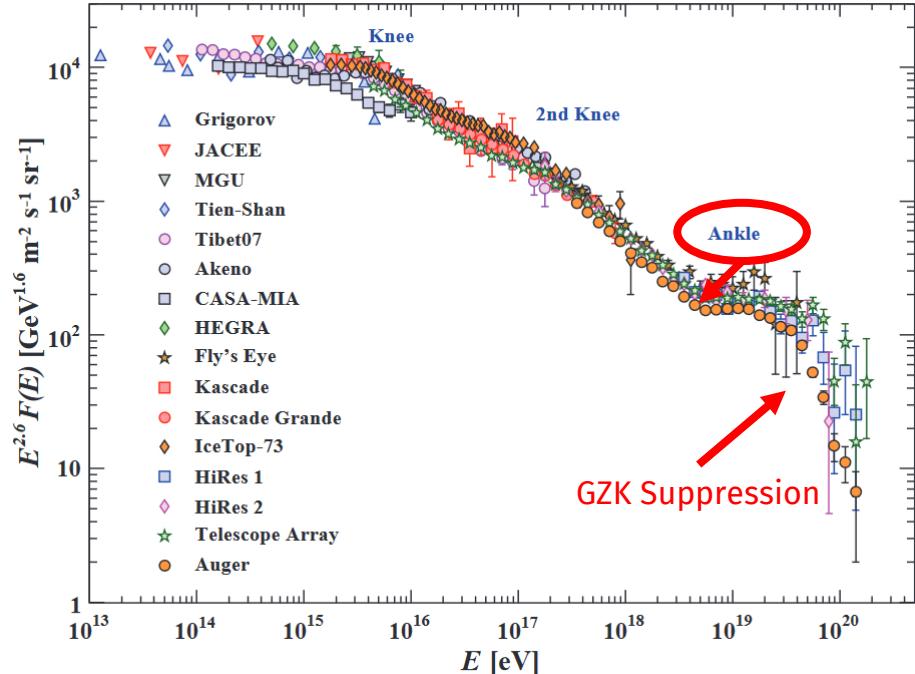

- Charged particles moving through the universe
  - Predominantly atomic nuclei
- Propagation is influenced by:
  - magnetic deflection
  - particle interactions
  - interactions with plasma clouds and astrophysical shock fronts
- Ultra-High Energy Cosmic Rays (UHECRs)
  - $E > 10^{18}$  eV

# Fundamental Questions

- What is the composition of cosmic rays?
- What are the sources of cosmic rays?
- **What is the cosmic ray energy density in the universe?**
  - **Cosmic Ray Energy Flux Spectrum**

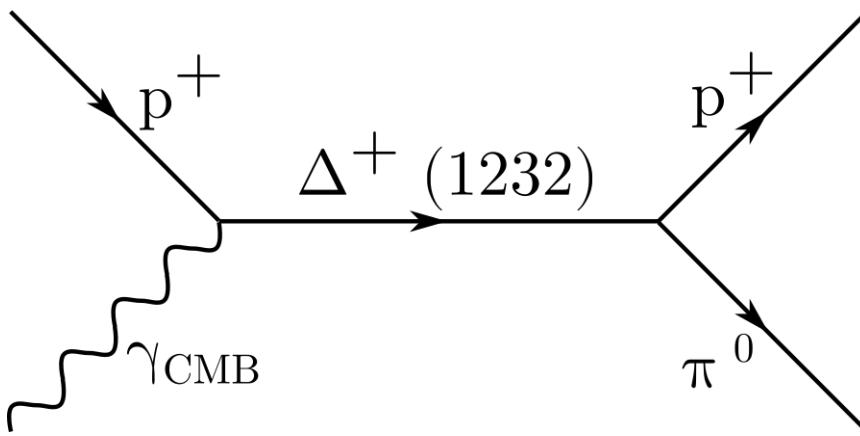

# Cosmic Ray Energy Spectrum

- Differential flux of events
  - For UHECR, we expect 1 event per  $\text{km}^2$  per century
- Two features above  $10^{17.5}$  eV
  - *Ankle*, possibly caused by:
    - transition from galactic to the extragalactic cosmic ray populations
    - Proton pair-production energy losses
  - GZK Suppression

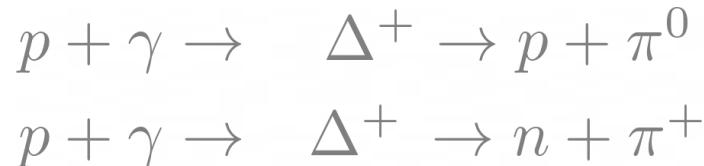

M. Tanabashi *et al.* (Particle Data Group), Phys. Rev. D **98**, 030001 (2018)

# GZK Suppression

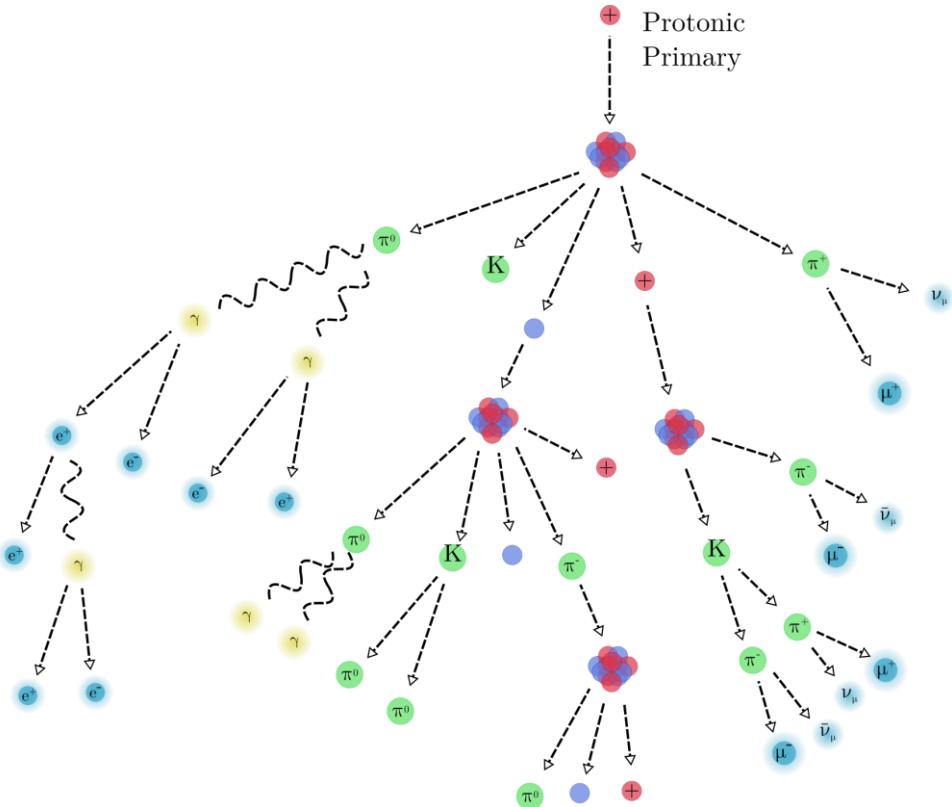

Particle Interactions :

Suppression of cosmic ray flux above the threshold due to the interaction of protons with the Cosmic Microwave Background photons :

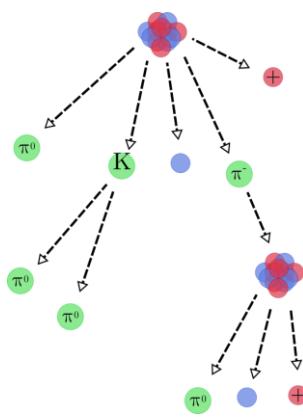

- Nucleon after interaction has less energy
- Threshold energy  $E_{\text{proton}} > 6 \times 10^{19} \text{ eV}$
- First observed by the HiRes experiment
  - followed by Telescope Array surface detectors, and Pierre Auger surface detectors

# Extensive Air Showers (EASs)

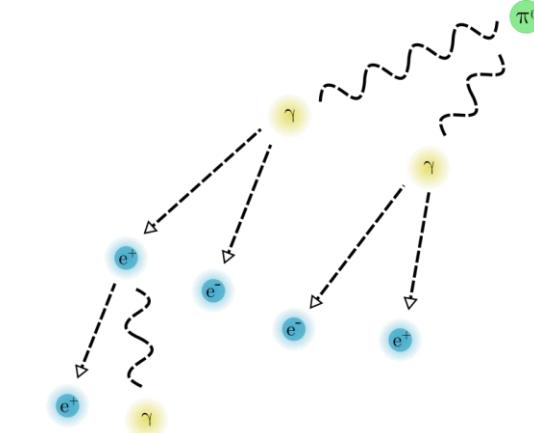

- Primary cosmic ray initiates a particle shower high in the atmosphere
- Shower continues until the energy is spread over many particles
- Shower has 3 main components

# Extensive Air Showers Components

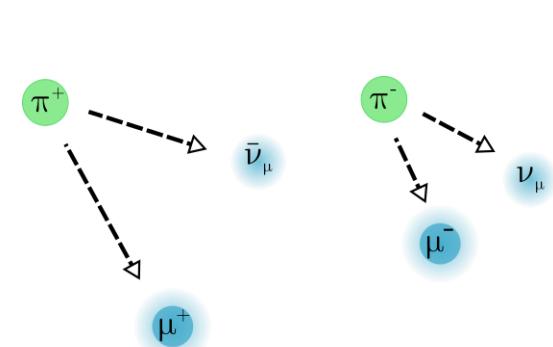

Hadronic Component :

- Core of the EAS
- Interaction of hadrons with the air molecule nuclei
- Feed into the other components

Electromagnetic (EM) Component :

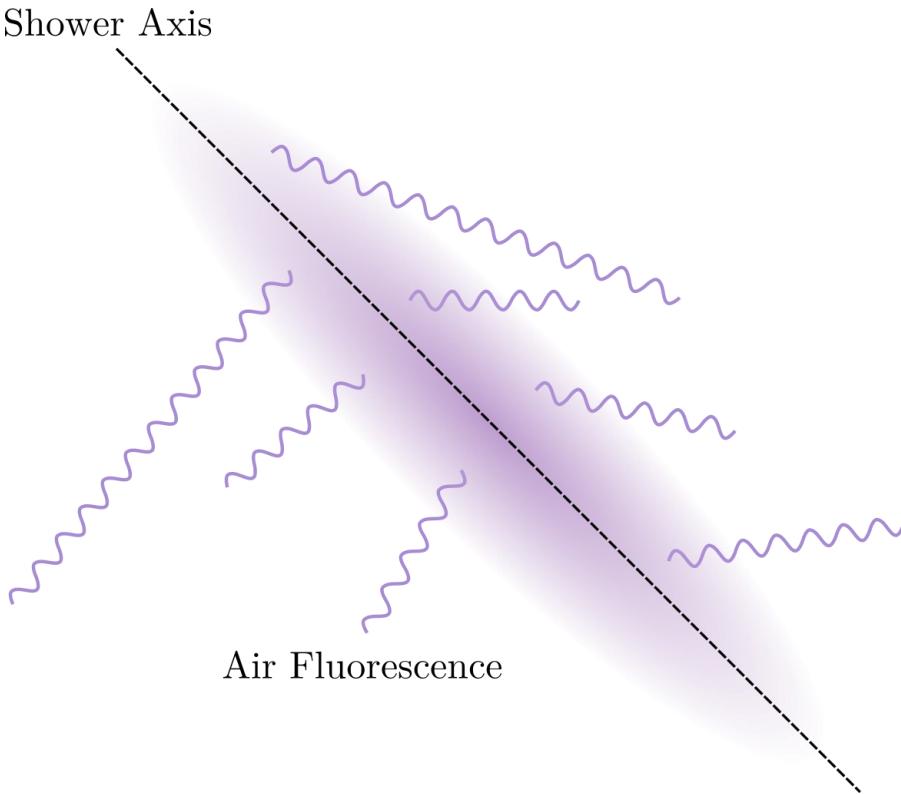

- photons produced in the EAS from the decay of  $\pi^0$
- Photons undergo pair-production
- Electrons undergo bremsstrahlung

Muonic Component :

- The  $\pi^\pm$  may decay into muons and neutrinos
- Energy carried away from the EAS
  - Missing Energy of the EAS
  - Up to 10% of the primary cosmic ray energy

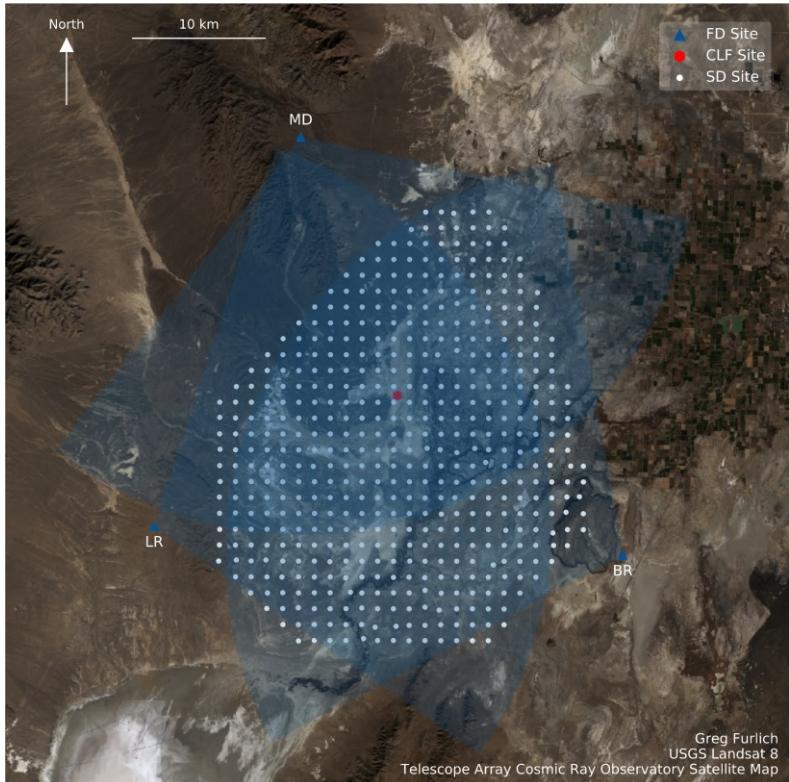

# Air Fluorescence

- Charged particles in the EAS excite the molecular nitrogen in the atmosphere
- Molecular nitrogen recombines and emits UV light
- The amount of light generated is dependent on the number of charged particles in the EAS
- Amount of light observed is dependent on atmospheric scattering (Rayleigh and Mie) and ozone absorption

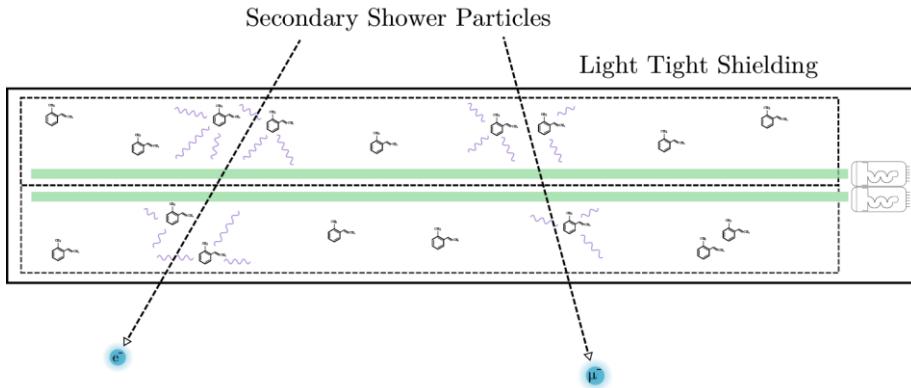

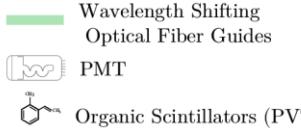

# Telescope Array (TA) Cosmic Ray Observatory and Expansions, TAx4

# Telescope Array (TA) Cosmic Ray Observatory

- Largest Cosmic Ray Observatory in the northern hemisphere
  - Covers 700 km<sup>2</sup> near Delta, UT
  - Hybrid detector for UHECRs
    - 507 Surface Detectors (SDs)
    - 3 Fluorescence Detectors (FDs) stations overlooking SD array
      - Black Rock (BR)
      - Long Ridge (LR)
      - Middle Drum (MD)

# Surface Detectors (SDs)

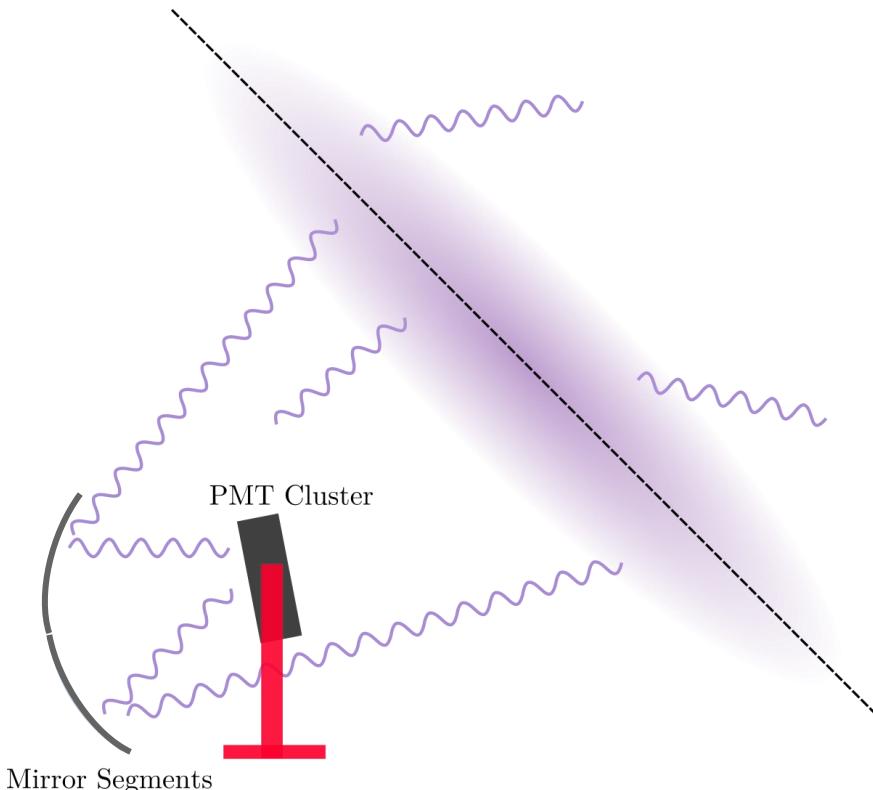

- Two sheets of scintillating organic compound
- As charged particles pass through, the scintillating material produces light
- Amount of light is converted into a digital signal
- SDs sample the footprint of particles in the EAS
- Operate nearly 100% of time

# TA SD in the Field

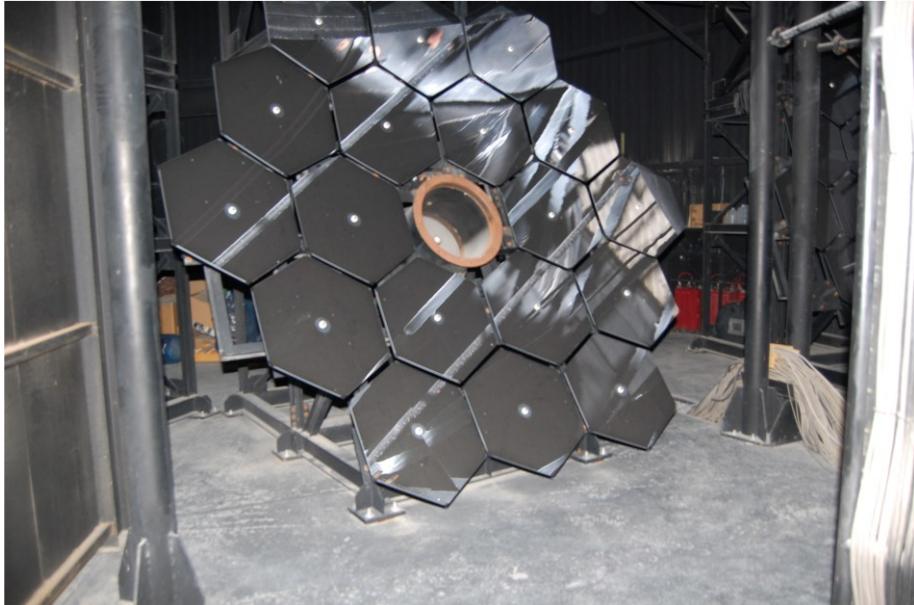

# Fluorescence Detectors (FDs)

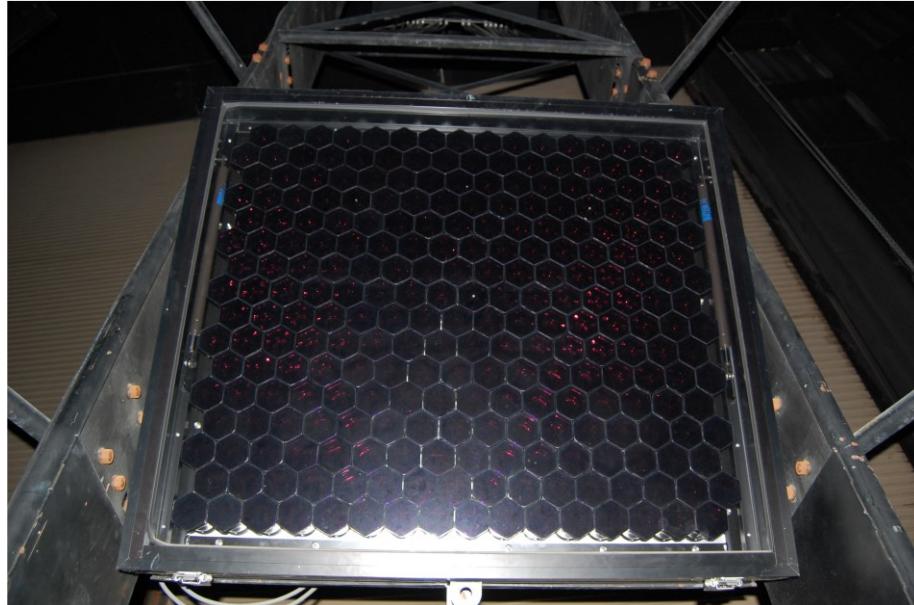

- EAS excites the molecular nitrogen in the atmosphere which emits light in the near UV (300-420 nm)
- The fluorescence light is collected using an array of mirrors onto a cluster of Photomultiplier Tubes (PMTs)
- Intensity of the light signal along the EAS track allows for reconstruction of the EAS charged particle profile
- Observes the energy deposited by the EAS in the atmosphere
- Operate roughly 10% of the time

# Black Rock Fluorescence Telescopes

Primary Mirror

16x16 PMT Cluster

# Black Rock FD Station

# Expansion of Telescope Array, TAx4

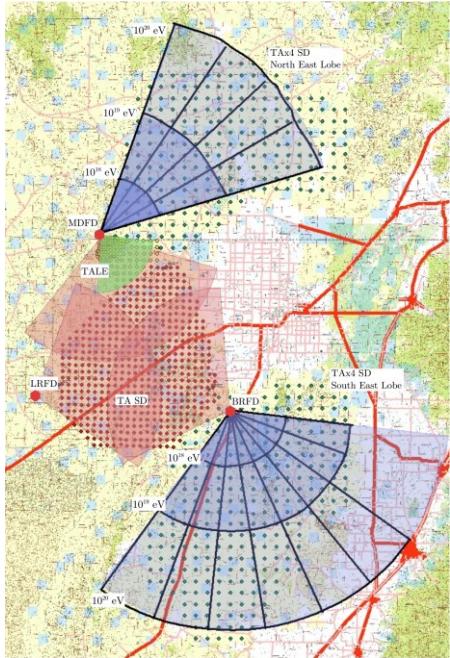

Image adapted from Bob Cady

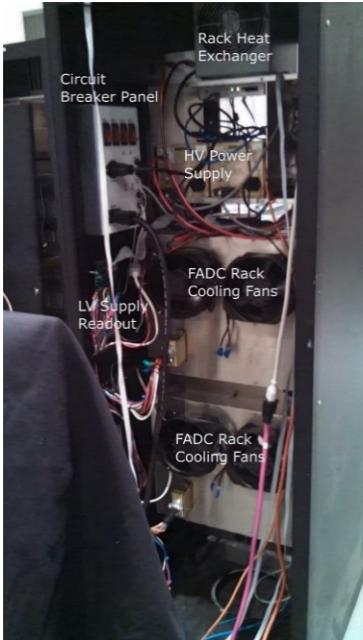

- Better observe a possible anisotropy of cosmic ray with  $E > 57$  EeV in the northern hemisphere
- Quadruple the detection aperture of TA
- 500 new SDs
- Expansion of the Middle Drum (MD) and Black Rock (BR) FD stations overlooking the new surface detector array
  - 4 new telescopes at MD
  - 8 new telescopes at BR

# Refurbishing and Testing the TAx4 FD Electronics Racks

Front

Back

- Refurbished 7 HiRes-II Fast Analog Digital Converters (FADCs) electronics racks
  - Control the operation, triggering, and read out of events in the telescopes
  - Upgraded components of the racks
- Tested racks in a darkroom with UVLED
- Tested 14 HiRes PMT clusters

# Fluorescence Detection Event Reconstruction

# Geometry Reconstruction

Shower Detector Plane (SDP) Calculation:

$$\chi^2 = \sum_{i=1}^{N_{\text{good}}} (\hat{n} \cdot \hat{v}_i)^2 N_{\text{pe},i}$$

$n$  : SDP normal vector

$v$  : PMT pointing direction

$N_{\text{PE}}$  : Photo-electrons per PMT

Timing Fit:

$$t_i = t_o + \frac{R_p}{c} \tan \left( \frac{\pi - \psi - \alpha_i}{2} \right)$$

$R_p$  : Impact parameter

$\Psi$  : Inclination angle in SDP

$\alpha$  : PMT pointing direction in the SDP

# Charged Particle Profile

Shower Parameterization of Shower Charged Particles with the Gaisser-Hillas Function:

$$N_{\text{ch}}(X) = N_{\text{max}} \left( \frac{X - X_0}{X_{\text{max}} - X_0} \right)^{\frac{X_{\text{max}} - X_0}{\lambda}} \exp \left( \frac{X_{\text{max}} - X}{\lambda} \right)$$

$N_{\text{ch}}$  : Charged Particles in EAS at depth  $X$

$N_{\text{max}}$  : maximum number of particles the shower creates

$X_{\text{max}}$  : depth of shower maximum

$X_0$  : approximate start of the shower

$\lambda$  : shower decay length.

Slant Depth:

$$X = \int \rho(r) dr$$

# Calorimetric Energy Reconstruction

Shower Energy Deposition:

$$\frac{dE_{\text{dep}}(X)}{dX} = \alpha(X)_{\text{eff}} N_{\text{ch}}(X)$$

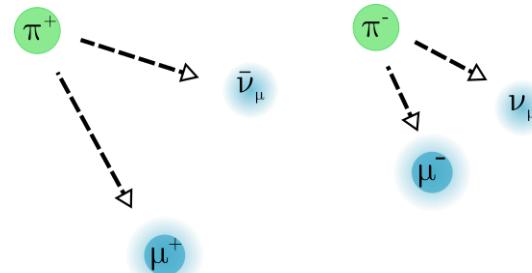

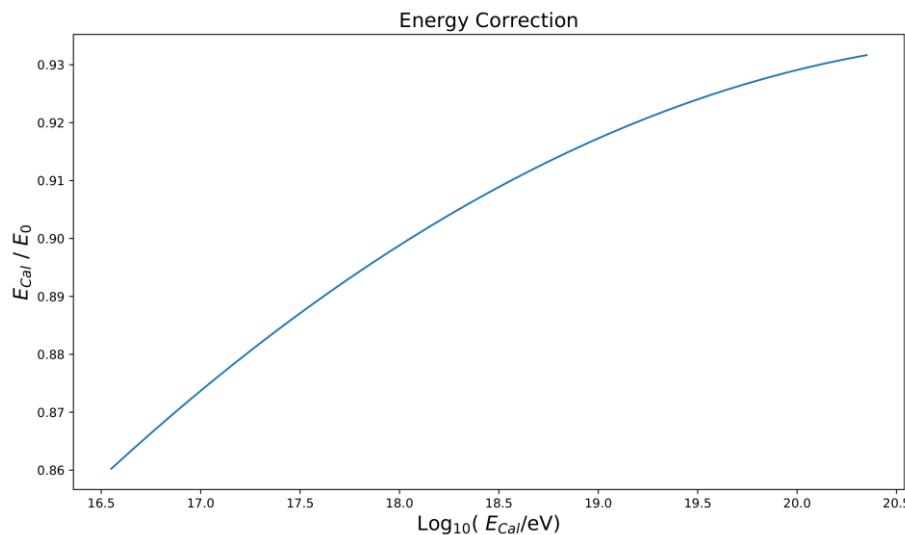

$\alpha(X)_{\text{eff}}$  : mean ionization energy loss of the charged particles to the atmosphere

Calorimetric Energy:

$$E_{\text{cal}} = \int_{X_0}^{\infty} \frac{dE_{\text{dep}}(X)}{dX} dX$$

# Missing Energy Correction

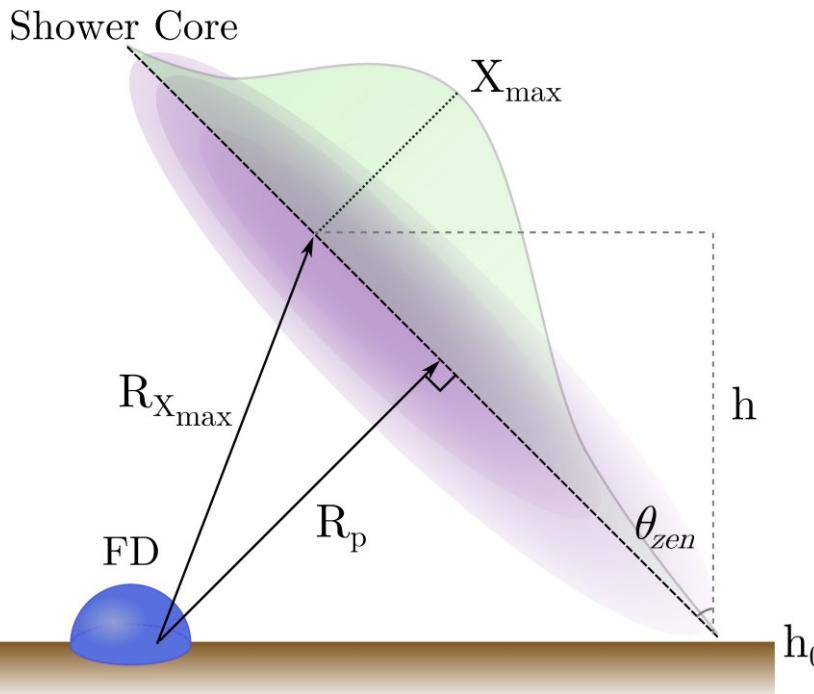

Account for energy carried away from EAS in muons and neutrinos and was not deposited in the atmosphere.

Energy Correction Function:

$$\frac{E_{\text{cal}}}{E_0} = -0.5717 + 0.1416 \log_{10}(E_{\text{cal}}/\text{eV}) - 0.003328 \log_{10}(E_{\text{cal}}/\text{eV})^2$$

# Distance to Shower Max, $R_{X\max}$

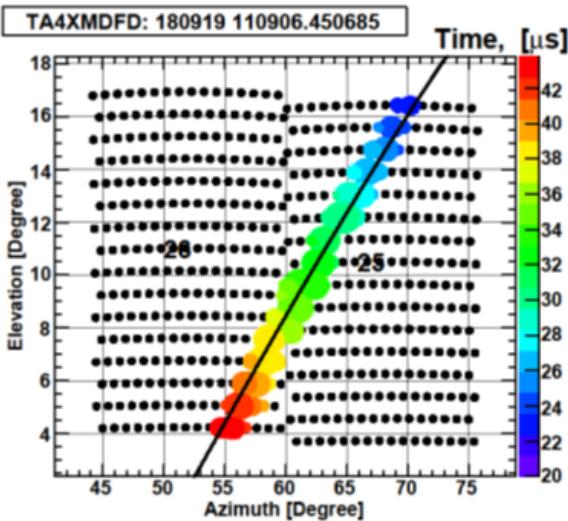

- $R_p$  is a construct of the geometry reconstruction
- $X_{\max}$  is the depth where the EAS is maximally developed
- $R_{X_{\max}}$  is a new parameter to gauge the detector's sensitivity to the shower brightness

$$h(X_{\max}, \theta_{zen}, h_0) = X^{-1}[X_{\text{top}} - X_{\max} \cos(\theta_{zen})] - h_0$$

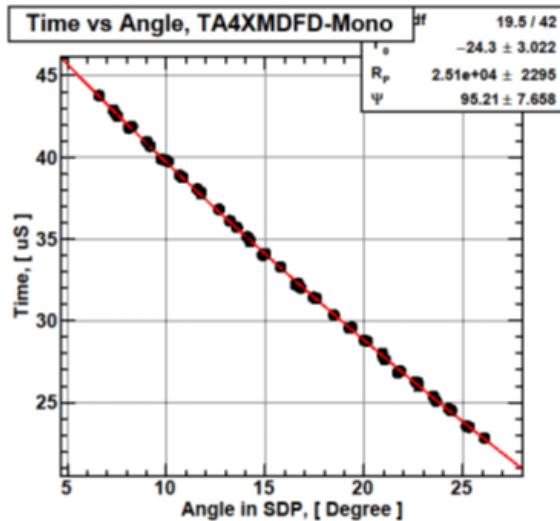

$$X_{\text{top}} = 1033.2 \text{ g/cm}^2$$

# TAx4 Good Event

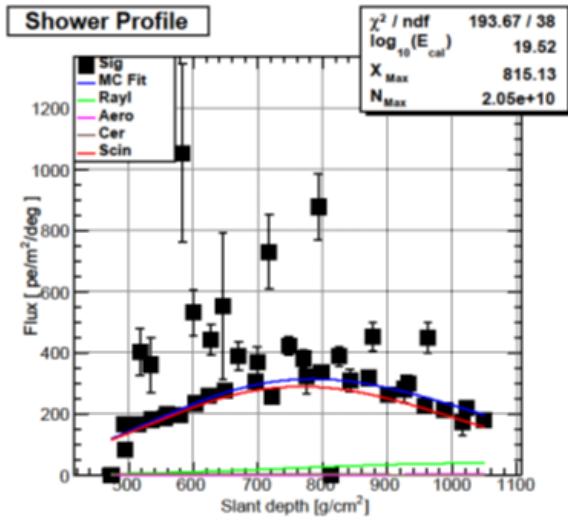

EAS Track

Event Timing

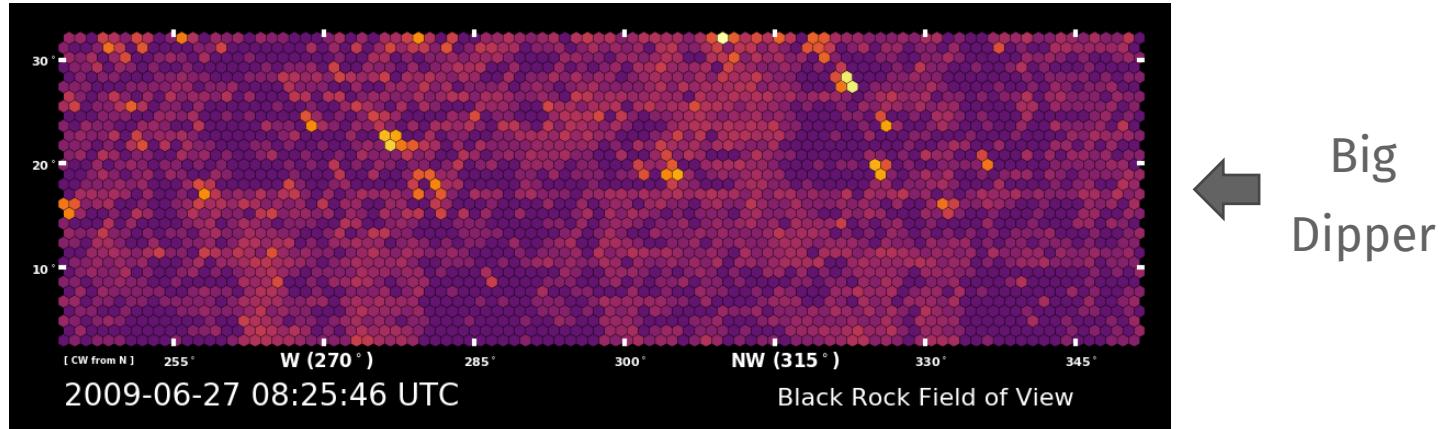

Event Profile

# Novel Machine Learning Weather Classification

# Weather Classification using FADC Pedestals

- Previous weather classification method is having operators at MD station go outside every hour and observe the night sky.
  - Assumed weather was identical at all 3 FD stations
- Implement a novel method that uses the BR and LR PMT FADC pedestals of each PMT to create false color animations of the night sky for each FD data part.

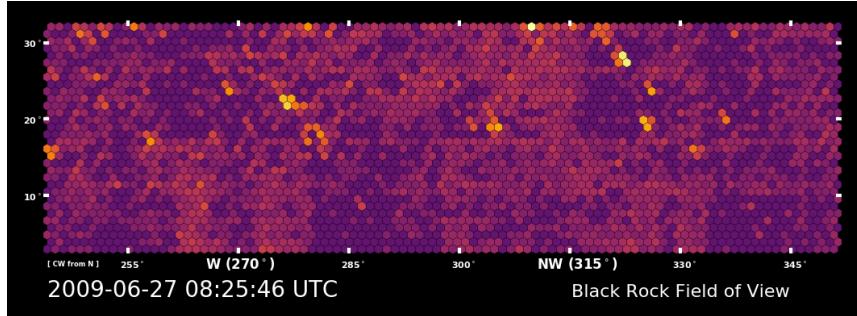

# Machine Learning Weather Classification

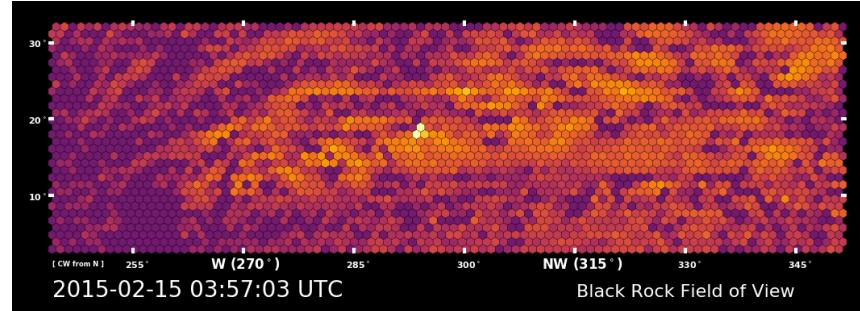

- Each FD data part was fed through a trained neural network for classification for both BR and LR.
  - Uniform classification method
  - Better timing resolution
- Designed four neural networks with increasing complexity to better match the input data
  - Recurrent Convolution Neural Network (RCNN)
    - Convolution layers train on spatial information in the animations
    - Recurrent Layers train on temporal information in the animations

# Weather Classes

Noisy

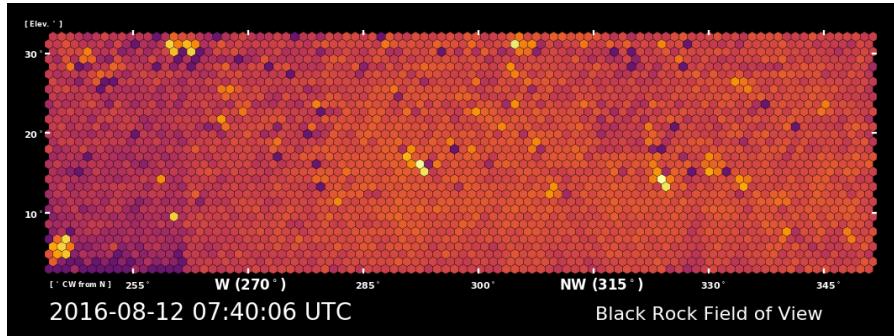

# Data Parts Weather Classification Results

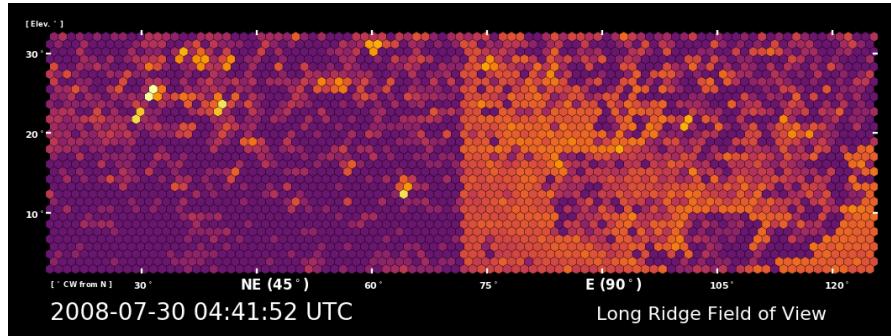

LR has 10% more Clear FD data parts than BR

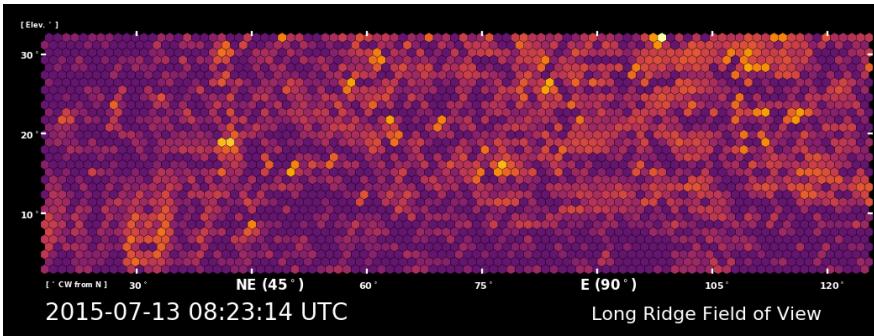

# Other Interesting Pedestal Events

2016 Perseid Meteor Shower

Transient Luminous Event called ELVES

Aurora Borealis

# Monte Carlo (MC) Simulated Events

# Monte Carlo (MC) Simulated Events

- MC events are populated with random geometry, energy, and compositions according to selection distributions and are *thrown* around the detector
- MC has two purposes:
  - Event reconstruction resolution of comparing the thrown *true* values to the reconstructed values
  - Determine the detection aperture
    - Good Data/MC comparisons to justify that the MC events represent the observed events

Acceptance

$$\text{Acceptance}(E) = \frac{N(E)_{\text{Recon.}}}{N(E)_{\text{Thrown}}}$$

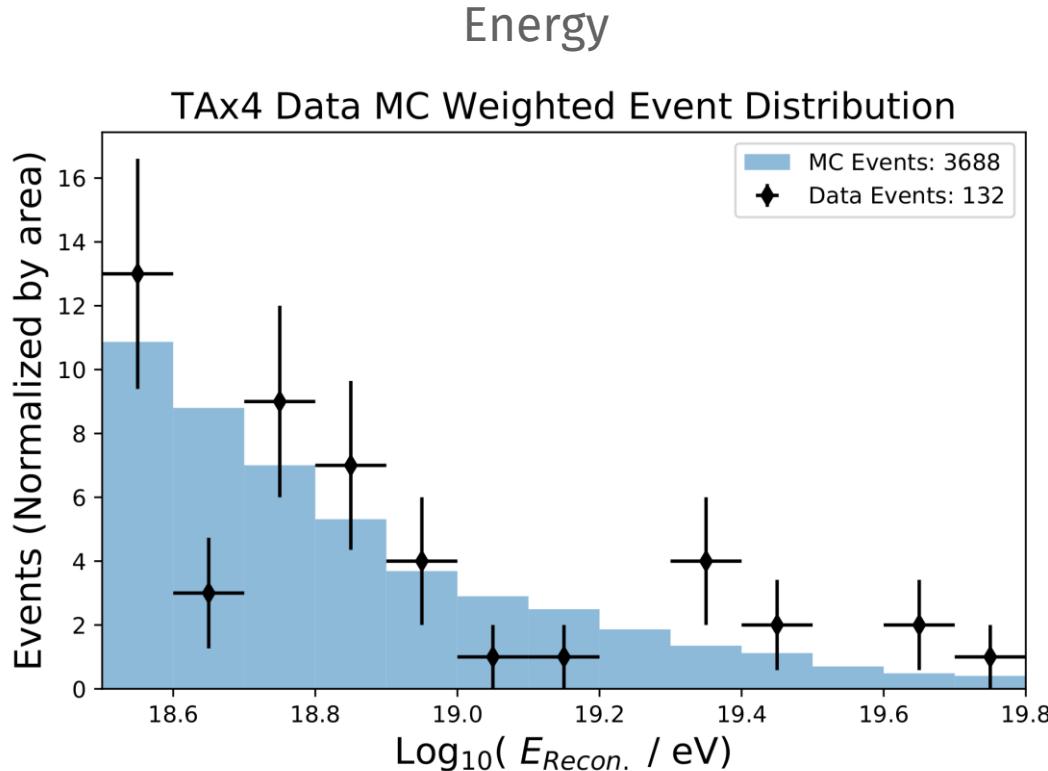

Aperture

$$A\Omega(E) = A_0\Omega_0 \times \text{Acceptance}(E)$$

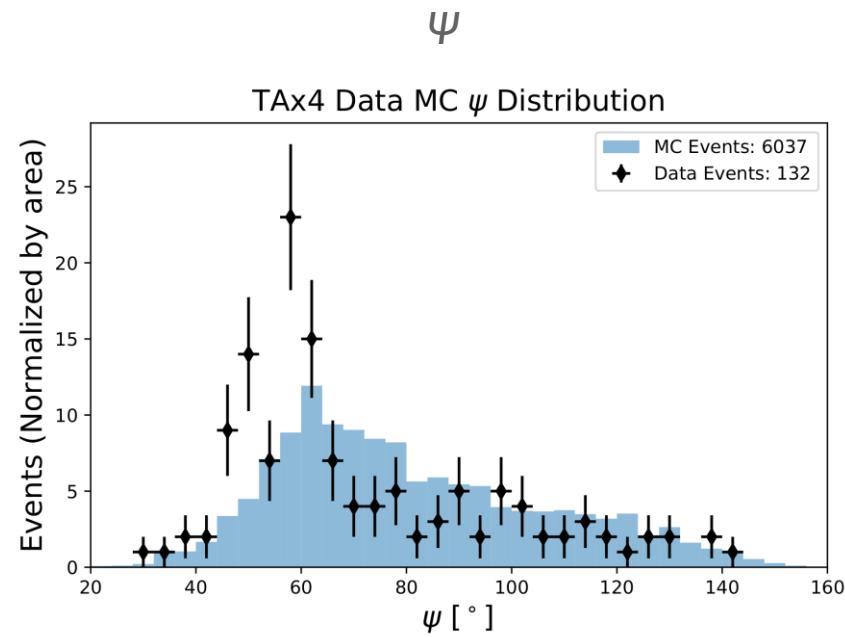

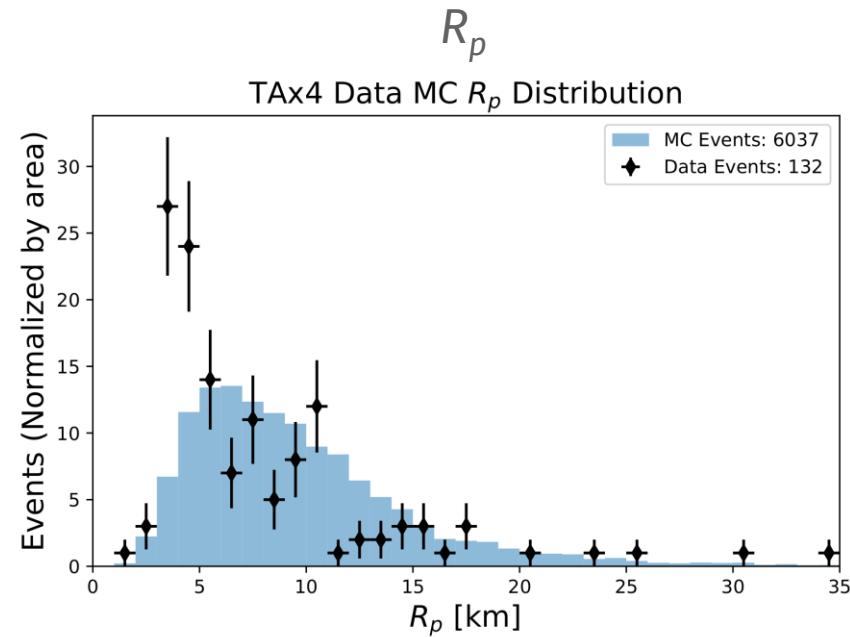

# MC Simulation Procedure

- I. Set MC configuration (thrown volume, calibration, etc.)
- II. Set MC event parameters (energy, geometry, shower profile) and throw event
- III. Simulate light production
- IV. Simulate light propagation
- V. Simulate detector optics
- VI. Simulate detector electronics and triggering
- VII. Read out triggered MC events

# TAx4 Data/MC (1/2)

# TAx4 Preliminary Spectrum

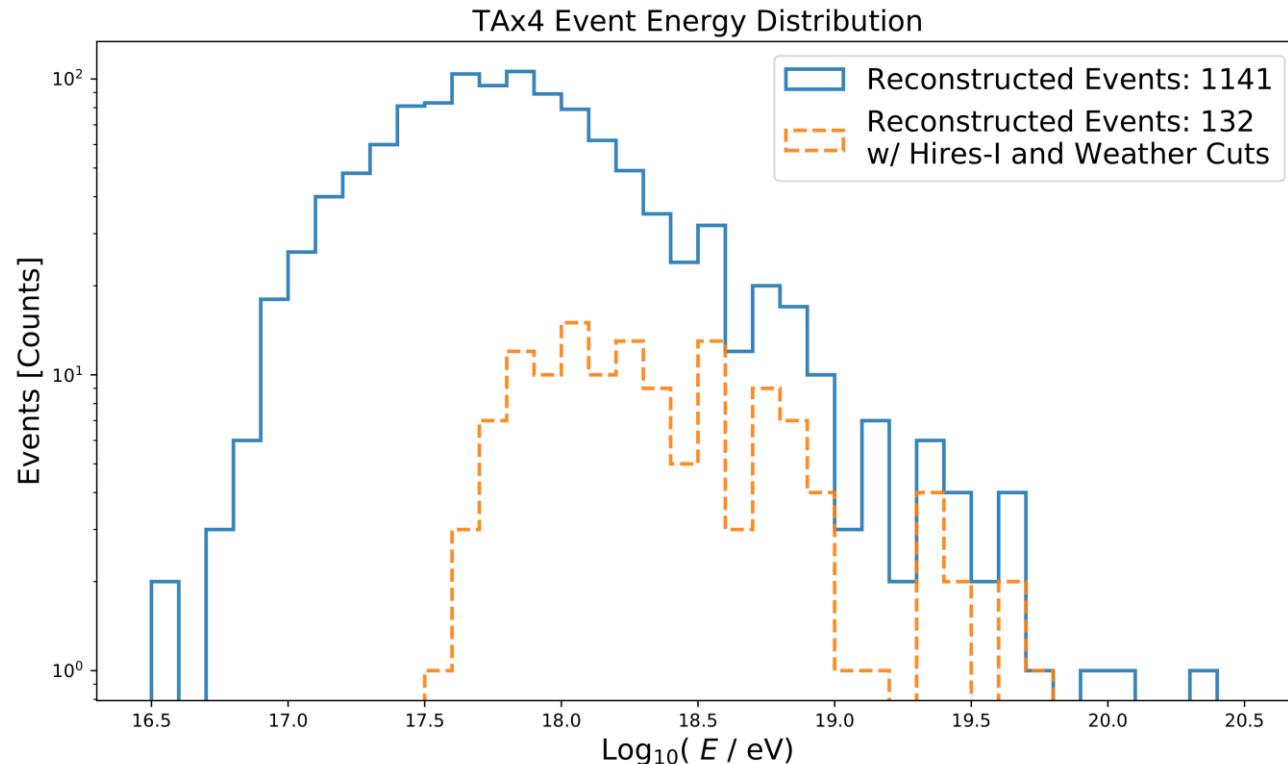

# Cosmic Ray Spectrum

- Differential flux of particles as a function of energy
- Represents the energy density of cosmic rays in the universe
- Features in the spectrum are insight into cosmic ray populations

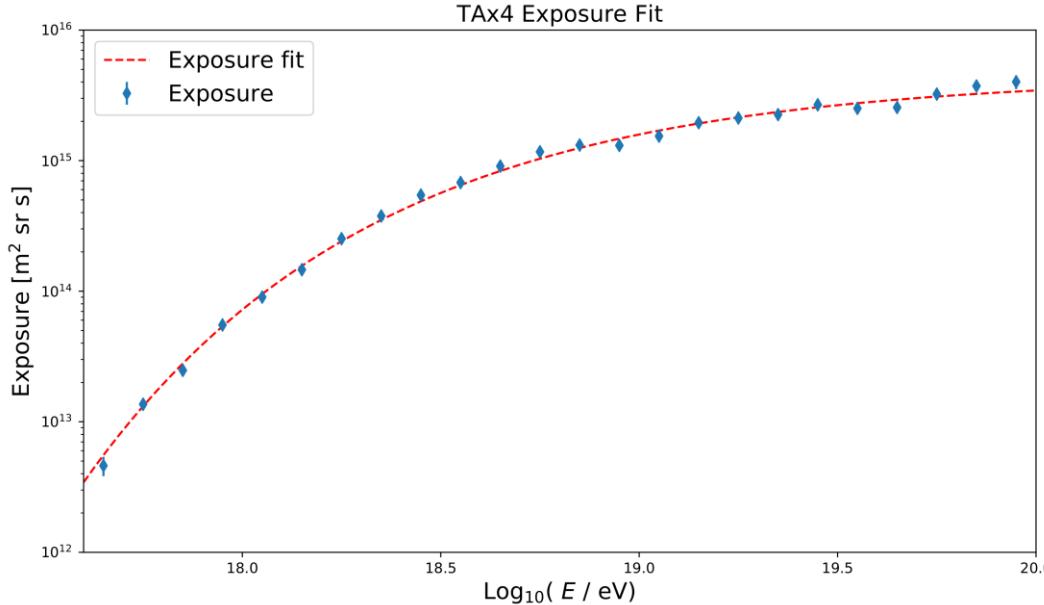

$$J(E_i) = \frac{N(E_i)}{\Delta E_i A\Omega(E_i) T}$$

$N(E_i)$ :	Event Distribution
$\Delta E_i$ :	Bin Size
$A\Omega(E_i)$ :	Detector Aperture
$T$ :	Detector Ontime
$\xi(E_i) = A\Omega(E_i)T$	Detector Exposure

# TAx4 Event Distribution

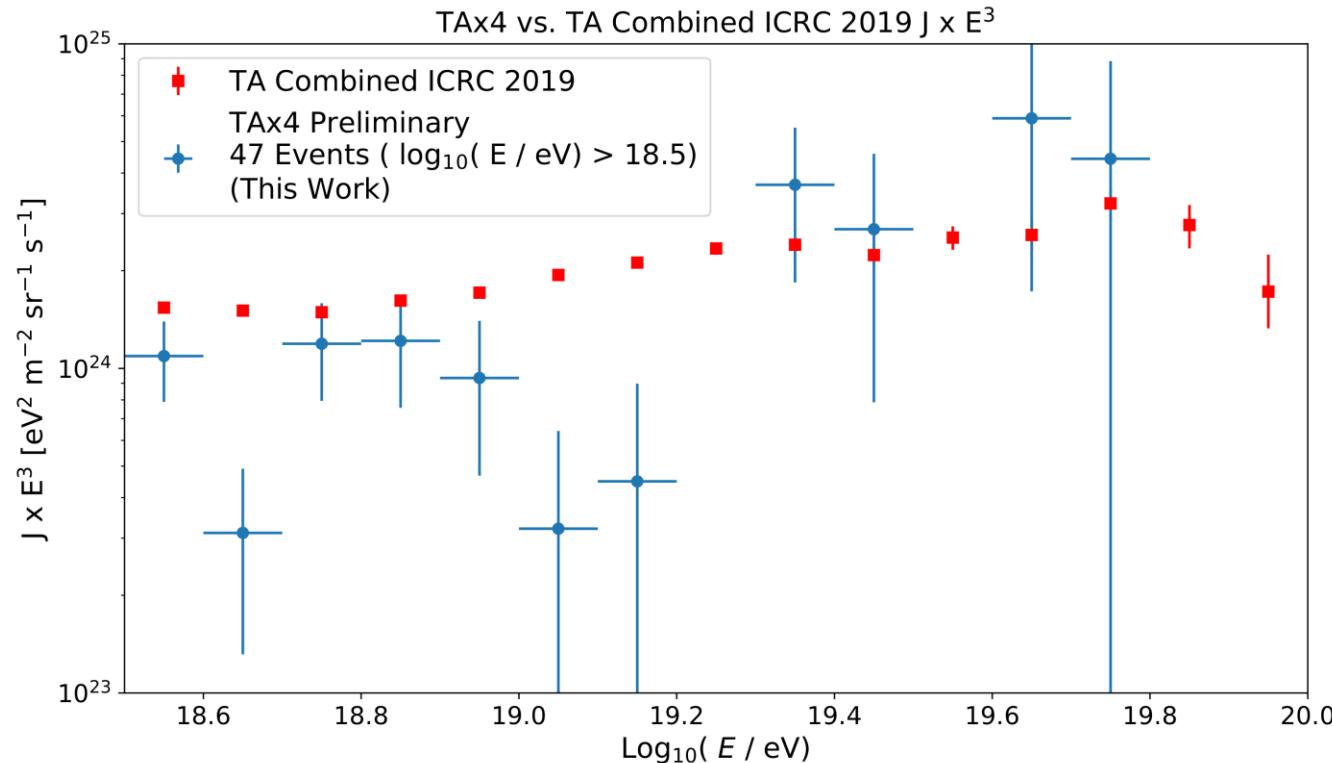

# TAx4 Exposure

Exposure Fit Function

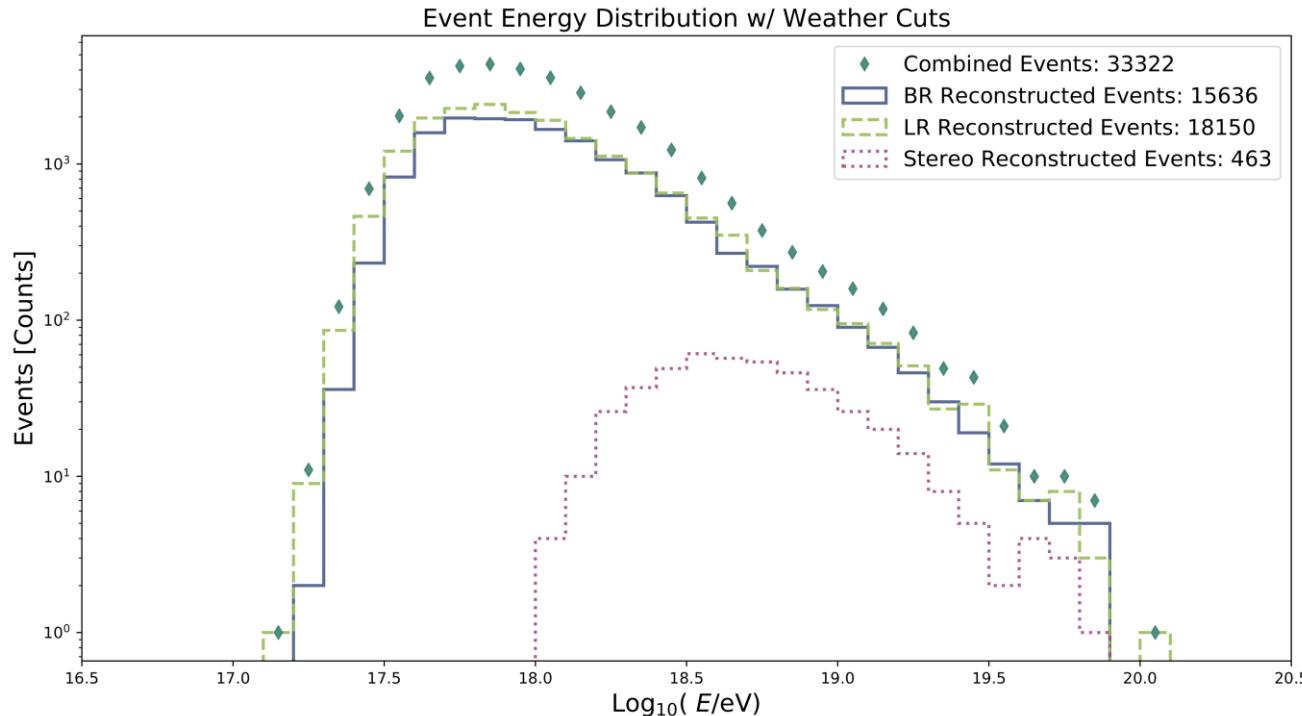

$$\log_{10} \xi(E) = p_1 \left( 1 - \exp \left[ -\frac{\varepsilon - p_2}{p_3} \right] \right)$$
$$\varepsilon = \log_{10}(E/\text{eV})$$

# TAx4 Preliminary Spectrum

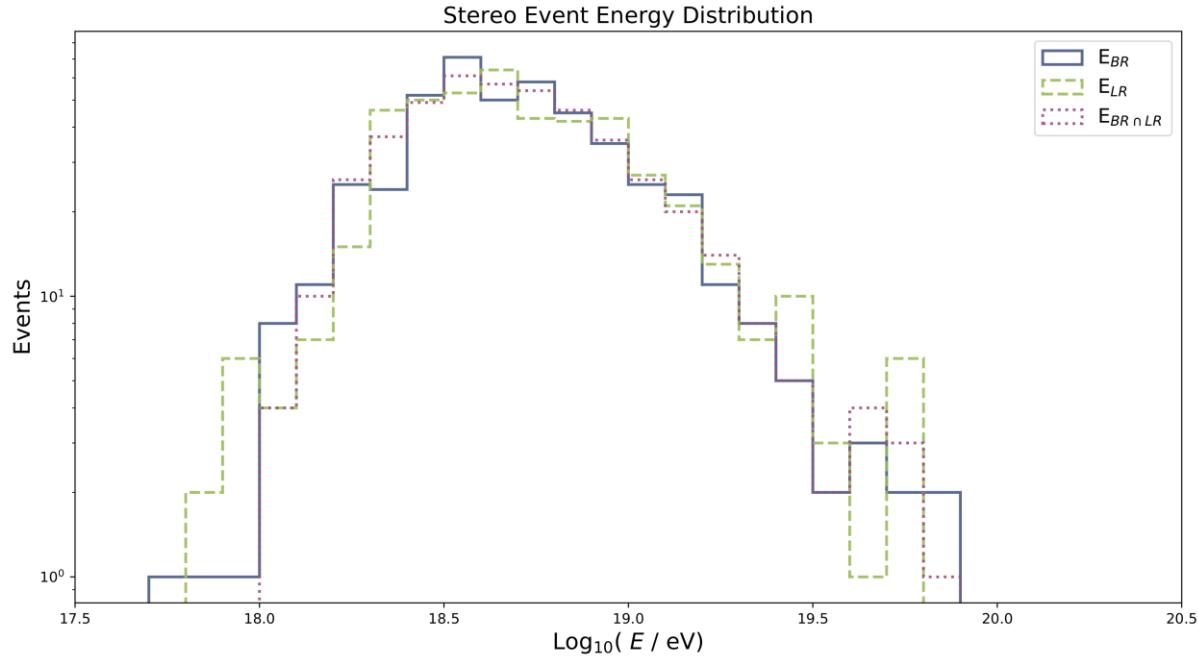

# 10 year BR and LR Monocular Combined Spectrum and Observation of the GZK Suppression

# Mono Combined Event Distribution

$$N(E_i)_{\text{Combined}} = N(E_i)_{\text{BR}} + N(E_i)_{\text{LR}} - N(E_i)_{\text{BR} \cap \text{LR}}$$

# Stereo Events

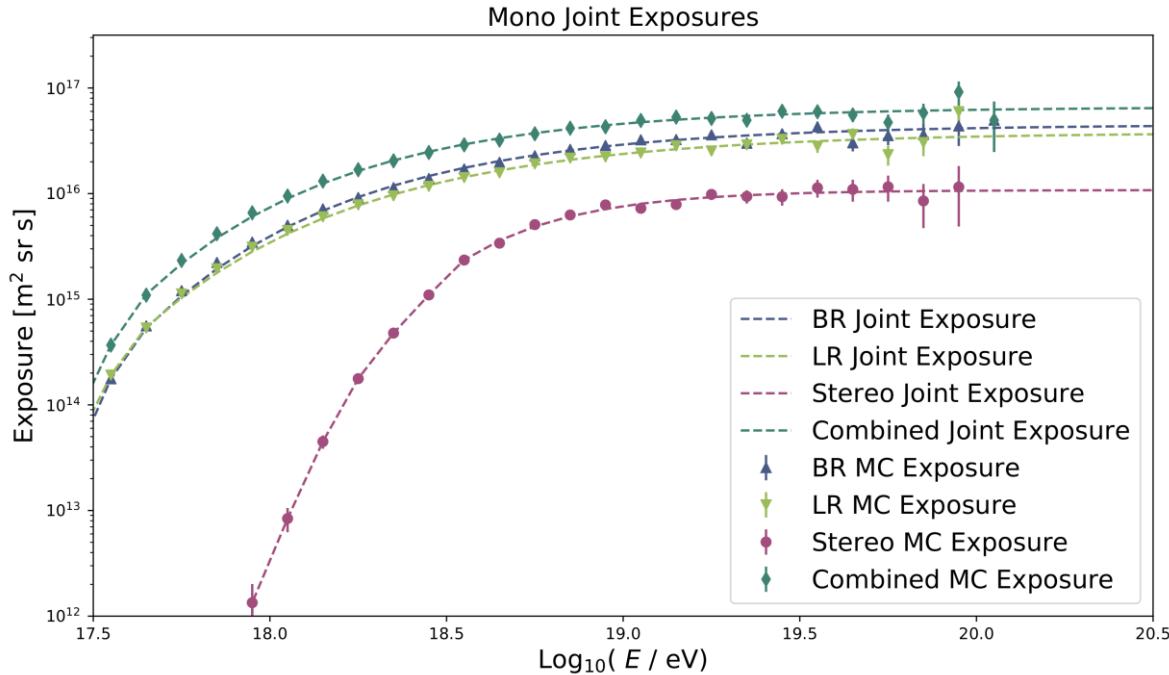

## Stereo Energy

$$E_{\text{Stereo}} = E_{\text{BR} \cap \text{LR}} = \sqrt{E_{\text{BR}} \times E_{\text{LR}}}$$

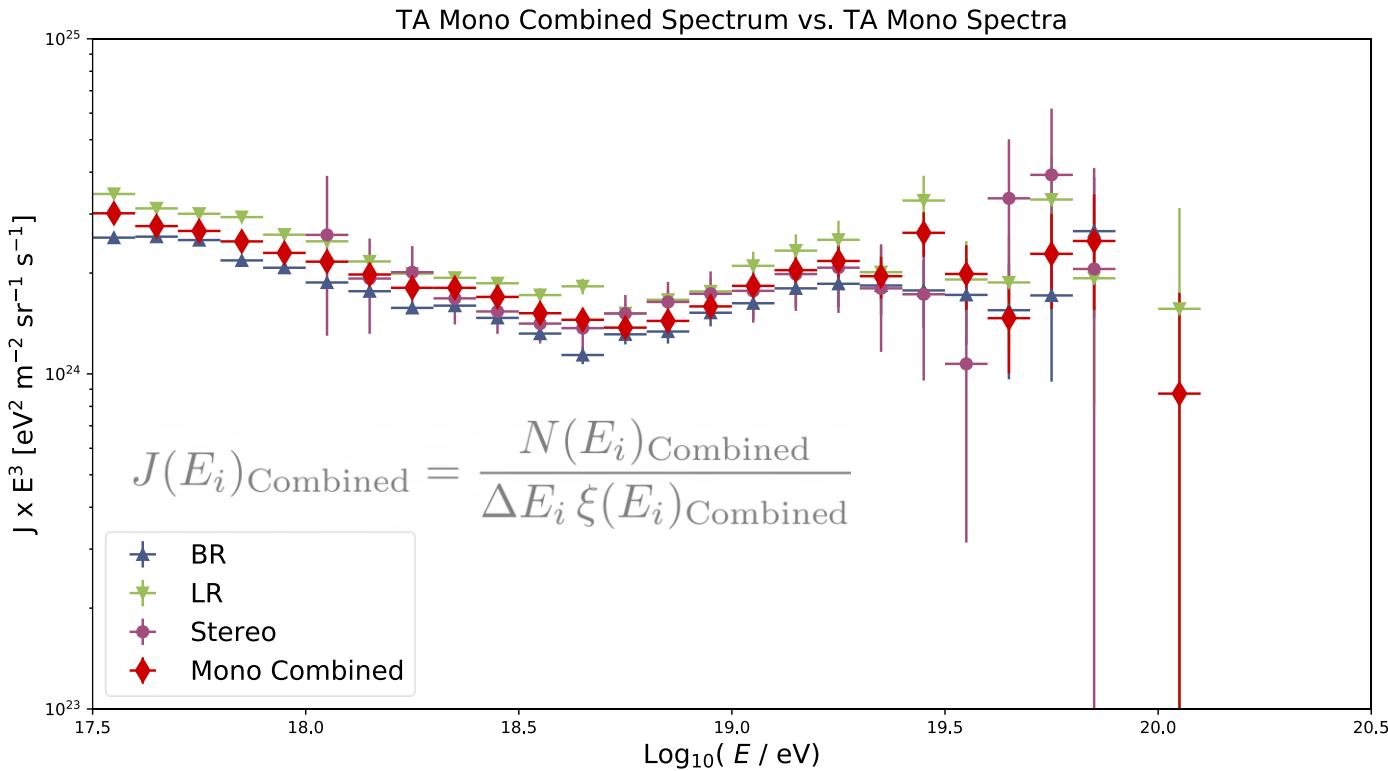

# Mono Combined Exposure

Joint exposure using calculated exposure and fit exposure

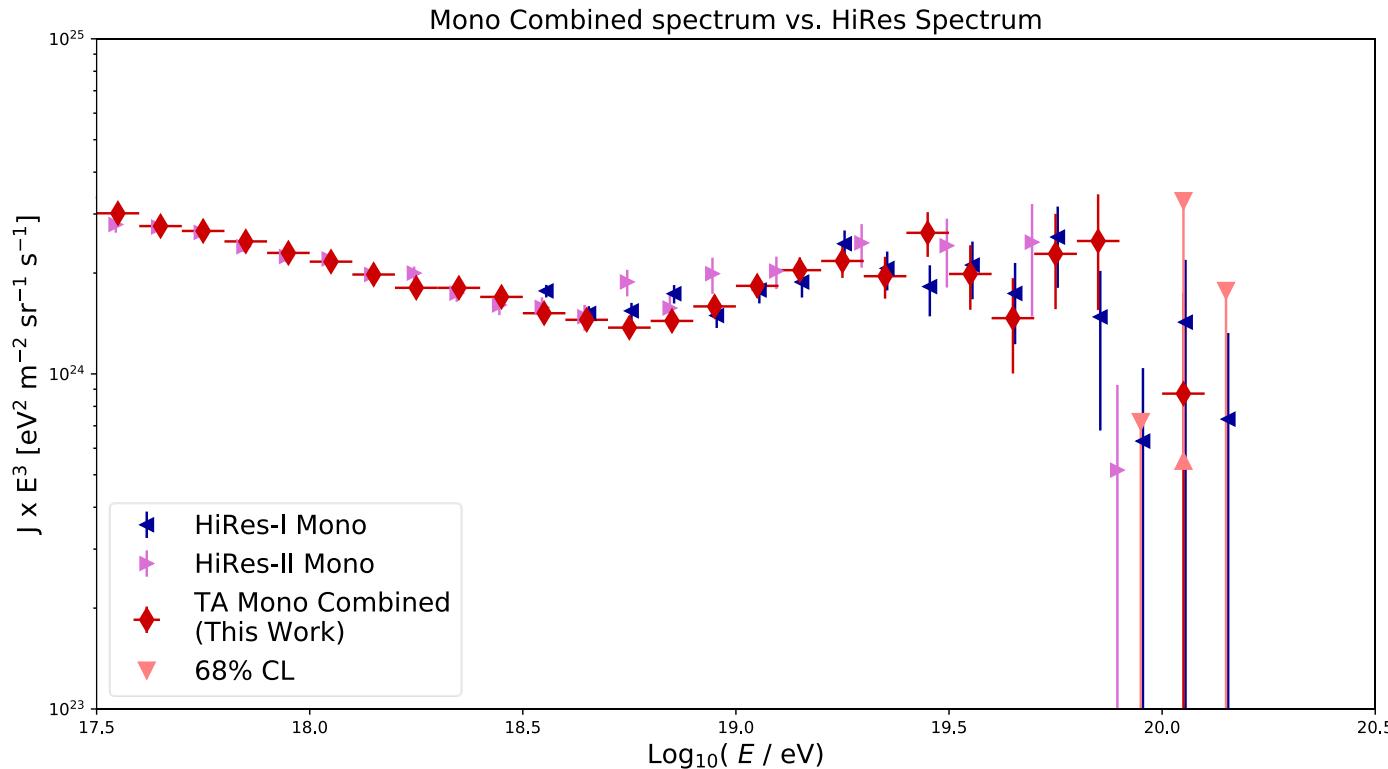

$$\xi(E)_{\text{Combined}} = A\Omega(E_i)_{\text{BR}} T_{\text{BR}} + A\Omega(E_i)_{\text{LR}} T_{\text{LR}} - A\Omega(E_i)_{\text{BR} \cap \text{LR}} T_{\text{BR} \cap \text{LR}}$$

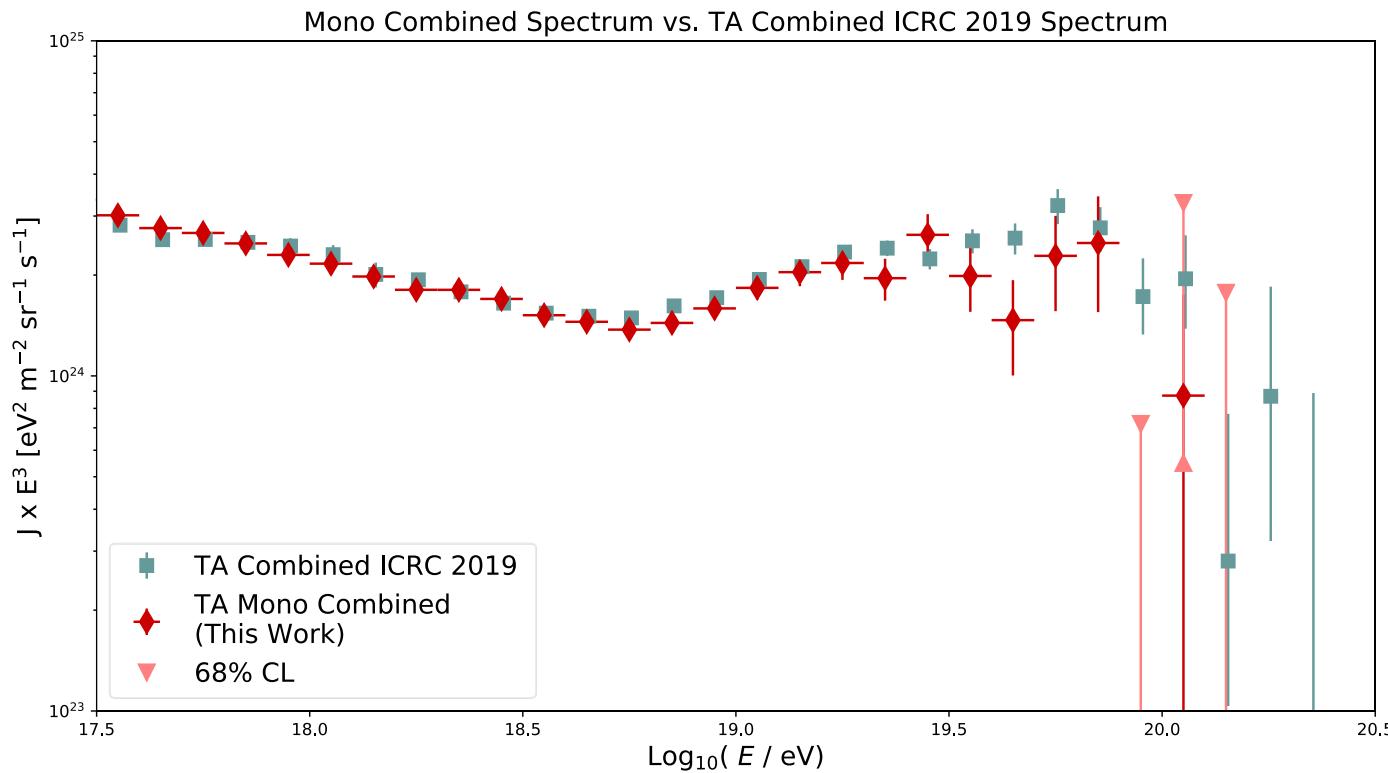

# Mono Combined Spectrum vs Mono Spectra

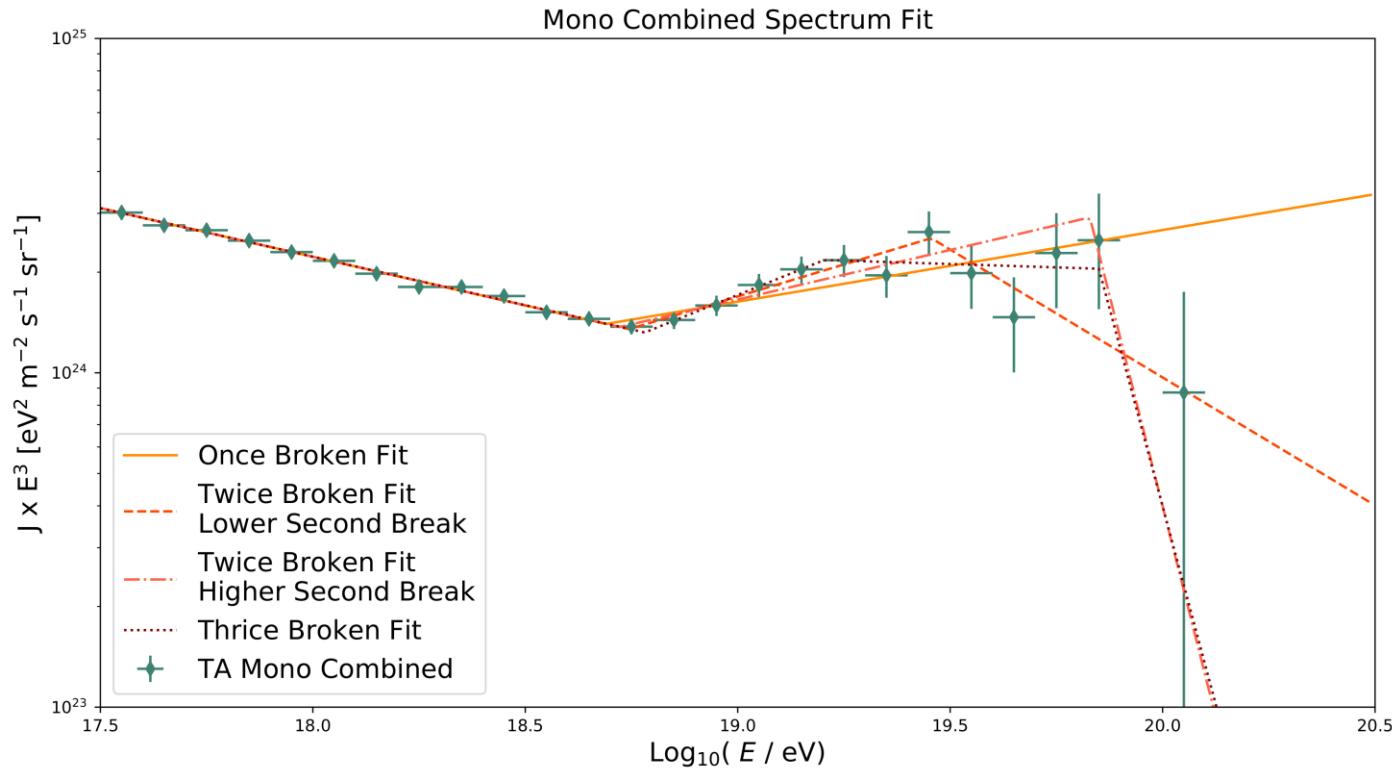

# Mono Combined Spectrum vs. HiRes

# Mono Combined Spectrum vs. TA Combined ICRC 2019

# Fitting the Spectrum with Broken Power Laws

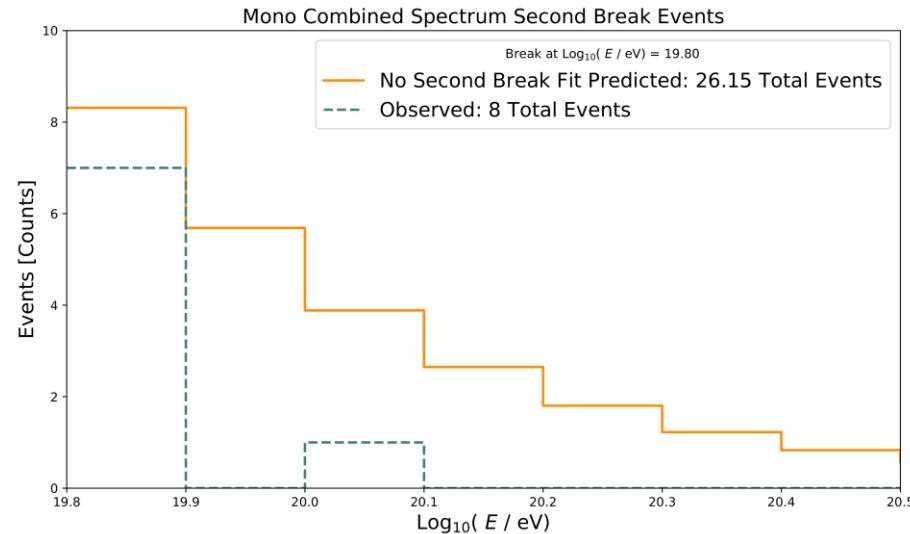

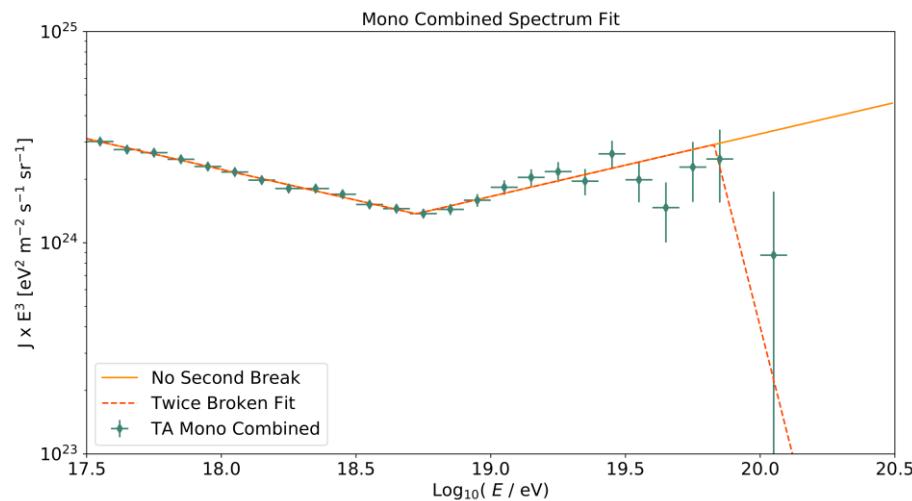

# Spectrum Broken Power Law Fit Results

	$J(E)_{\text{Once Broken}}$	$J(E)_{\text{Twice Broken, Lower } E_2}$	$J(E)_{\text{Twice Broken, Higher } E_2}$	$J(E)_{\text{Thrice Broken}}$
$J(E = 10^{18} \text{ eV})$	$2.22 \pm 0.01$	$2.22 \pm 0.01$	$2.22 \pm 0.01$	$2.23 \pm 0.01$
$\times 10^{-30} \text{ eV}^{-1} \text{ m}^{-2} \text{ sr}^{-1} \text{ s}^{-1}$				
$\gamma_1$	$-3.29 \pm 0.01$	$-3.29 \pm 0.01$	$-3.29 \pm 0.01$	$-3.29 \pm 0.01$
$\log_{10}(E_1 / \text{eV})$	$18.68 \pm 0.04$	$18.74 \pm 0.03$	$18.72 \pm 0.05$	$18.78 \pm 0.04$
$\gamma_2$	$-2.79 \pm 0.05$	$-2.62 \pm 0.06$	$-2.70 \pm 0.05$	$-2.49 \pm 0.15$
$\log_{10}(E_2 / \text{eV})$	-	$19.46 \pm 0.10$	$19.83 \pm 0.04$	$19.20 \pm 0.11$
$\gamma_3$	-	$-3.77 \pm 0.41$	$-8.04 \pm 2.74$	$-3.04 \pm 0.19$
$\log_{10}(E_3 / \text{eV})$	-	-	-	$19.850 \pm 0.001$
$\gamma_3$	-	-	-	$-7.74 \pm 2.43$
D <sub>Poisson</sub> / ndf	$43.45 / 26$	$22.69 / 24$	$23.29 / 24$	$17.74 / 22$

- $J(E)_{\text{Twice Broken}}$  higher  $E_2$  agrees with previous measurements
- $J(E)_{\text{Thrice Broken}}$  has the best deviance compared to the other fits.
  - Suggests another break besides the ankle and GZK suppression at  $\log_{10}(E / \text{eV}) = 19.2$

# Observation of the GZK Suppression

Using the higher  $E_2$  twice broken power law fit since it is in agreement with previous results

# GZK Suppression Significance

Poisson Probability

$$P_{\text{GZK}} = \sum_{n=0}^{N_{\text{Observed}}} P_{\text{Poisson}}(n, N_{\text{Expected}})$$

Two-tailed Sigma significance

$$1 - P_{\text{GZK}} = F(\mu + n\sigma) - F(\mu - n\sigma) = \text{erf}\left(\frac{n}{\sqrt{2}}\right)$$

F is a normal distribution of mean ,  $\mu$ ,  
and standard deviation  $\sigma$

	$J(E)$ Twice Broken Lower $E_2$	$J(E)$ Twice Broken Higher $E_2$
$\log_{10}( E_2 / \text{eV} )$	$19.46 \pm 0.10$	$19.83 \pm 0.04$
$N_{\text{Expected}}$	96.88	26.15
$N_{\text{Observed}}$	49	8
$P_{\text{GZK}}$	$5.82 \times 10^{-8}$	$3.37 \times 10^{-5}$
$\sigma_{\text{GZK}}$	5.42	4.15

# Integral Flux and $E_{1/2}$

Cosmic Ray Integral Flux :

$$I(E) = \int_E^\infty J(E') dE'$$

$E_{1/2}$  calculation:

$$\log_{10}(\text{E}_{1/2} / \text{eV}) = \log_{10}(\text{E}_2 / \text{eV}) + \frac{1}{\gamma_2 - \gamma_3} \log_{10} \left( 2 \frac{\gamma_2 + 1}{\gamma_3 + 1} \right)$$

$E_{1/2}$  is where the integral flux has halved compared an unbroken integral flux past  $E_2$ .  
Provides an astrophysical interpretation of the GZK suppression energy threshold.

	$J(E)$ Twice Broken Lower $E_2$	$J(E)$ Twice Broken Higher $E_2$	TA SD ICRC 2019	HiRes
$\log_{10}(\text{E}_{1/2} / \text{eV})$	$19.51 \pm 0.12$	$19.77 \pm 0.04$	$19.79 \pm 0.04$	$19.73 \pm 0.07$

# Conclusion – Give me a (spectrum) break!

- TAx4 FD was refurbished, tested, deployed, and first light was collected
- A preliminary spectrum using the first year of TAx4 MD FD data was calculated
  - Agreement with previous measurements
  - TAx4 FD will work well for calculating the TAx4 SD energy scale with hybrid events
- A novel machine learning weather classification method was implemented for BR and LR
- A 10 year combined energy spectrum was calculated
  - Excellent agreement with previous results
  - Thrice broken power law fits suggests a break at  $\log_{10}(E / \text{eV}) = 19.2$
  - The GZK suppression was observed above  $4\sigma$  significance
  - The effective GZK energy,  $E_{1/2}$ , agrees with previous measurements
  - 4<sup>th</sup> observation of the GZK suppression

# TAx4 FD Epochs

## **Epoch 0** (2018/06/08 - 2019/04/09):

The initial TAx4 MD FD epoch since the FD became fully operational and started collecting data every night.

## **Epoch I** (2019/04/24 - 2019/06/08):

The column thickener daughter board was added to the trigger-host board for each telescope.

## **Epoch II** (20190625 - Present):

The intermirror trigger was enabled in the TAx4 operations software.

# Event Quality Cuts

## BR and LR Monocular :

### Event Geometry Reconstruction Cuts

Good PMT Fraction	$N_{\text{Good PMT}}/N_{\text{PMTs}} \geq 3.5\%$
Number Good PMTs	$N_{\text{Good PMT}} \geq 6$ Tubes
NPE per Degree	$N_{\text{pe}}/\Delta\theta > 25$ NPE / deg.
Pseudo Distance (angular speed of EAS)	$r_p > 1.5$ km $\leq 80^\circ$
SDP Angle	$R_p \geq .5$ km $\psi < 130^\circ$ $\sigma_\psi < 36^\circ$
$R_p$	
$\psi$	
$\psi$ fit uncertainty	
Timing Fit	<i>Successful Timing Fit</i>
Track Length 1 Ring	$\chi^2/\text{ndf} < 10$
Track Length 2 Ring	$\Delta\theta_{\text{Ring 1}} > 7^\circ$
Zenith Angle	$\Delta\theta_{\text{Ring 2}} > 10^\circ$
Crossing Time	$\theta_{\text{zen}} < 70^\circ$
Time Duration	$t_0 < 25.6 \mu\text{s}$
	$\Delta t > 6 \mu\text{s}$ (for $R_p < 5$ km)

### Event Profile Reconstruction Cuts

	<i>Successful Profile Fit</i>
First Depth	$150 \text{ g/cm}^2 \leq X_1 \leq 1200 \text{ g/cm}^2$
Observed Depth Extent	$\Delta X \geq 150 \text{ g/cm}^2$
$X_{\text{max}}$ Bracketing	$X_{\text{max}}$ is contained within the FOV

## TAx4 MD FD (Based on HiRes-I):

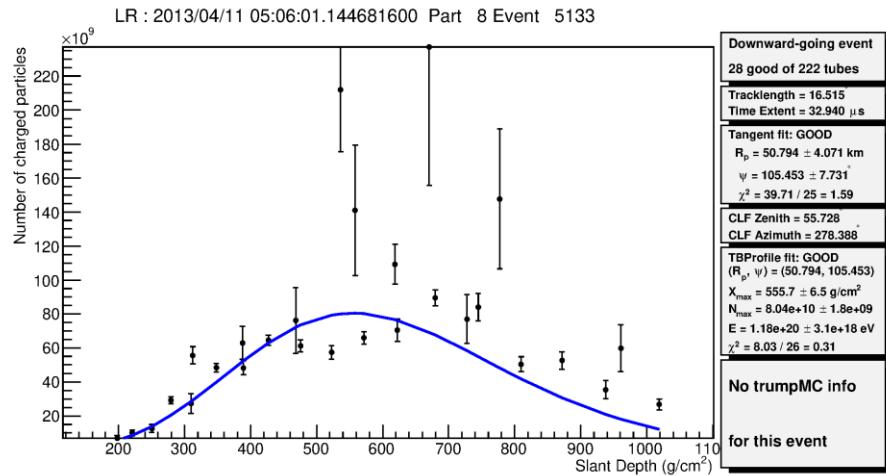

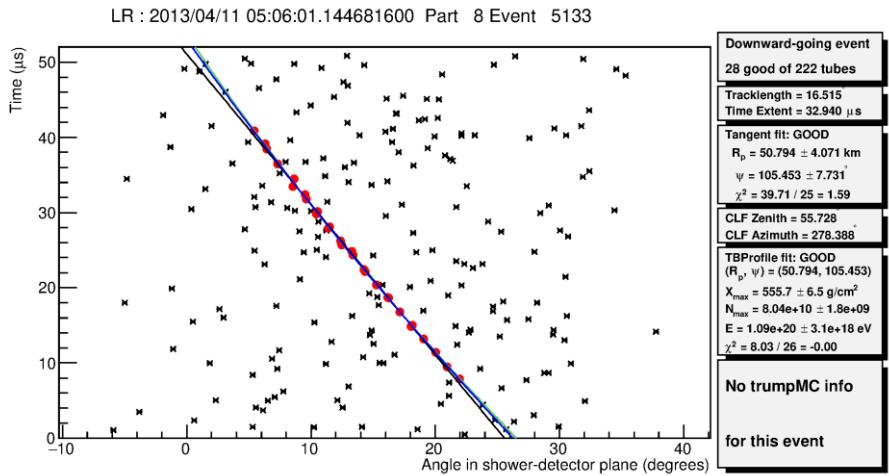

### Event Reconstruction Cuts

Rayleigh Filter	$P_{\log_{10}} \geq 2$
Brightness Cut	$\Sigma N_\gamma/N_{\text{Good PMTs}} \geq 200$
	$\Sigma N_{\text{pe}}/N_{\text{Good PMTs}} \geq 55$
Track Length	$\Delta\theta > 7.9^\circ$
Track Width RMS	$\theta_{\text{RMS}} \leq 1^\circ$
Angular Speed	$5.73^\circ/\mu\text{s}$
	<i>Successful Geometry Fit</i>
	<i>Successful Profile Fit</i>
Profile Fit	$\chi^2/\text{ndf} < 14$
Cerenkov Fraction	$f_{\text{Cerenkov}} < 20\%$
First Interaction	$X_1 \leq 1200 \text{ g/cm}^2$

$$J(E)_{\text{Thrice Broken}} = A \begin{cases} E^{\gamma_1} & E < E_1 \\ E_1^{\gamma_1 - \gamma_2} E^{\gamma_2} & E_1 \leq E < E_2 \\ E_1^{\gamma_1 - \gamma_2} E_2^{\gamma_2 - \gamma_3} E^{\gamma_3} & E_2 \leq E < E_3 \\ E_1^{\gamma_1 - \gamma_2} E_2^{\gamma_2 - \gamma_3} E_3^{\gamma_3 - \gamma_4} E^{\gamma_4} & E_3 \leq E \end{cases}$$

Poisson Deviance

$$D_{\text{Poisson}} = 2 \sum_i \left[ N(E_i)_{\text{Expected}} - N(E_i)_{\text{Observed}} + N(E_i)_{\text{Observed}} \ln \left( \frac{N(E_i)_{\text{Observed}}}{N(E_i)_{\text{Expected}}} \right) \right]$$

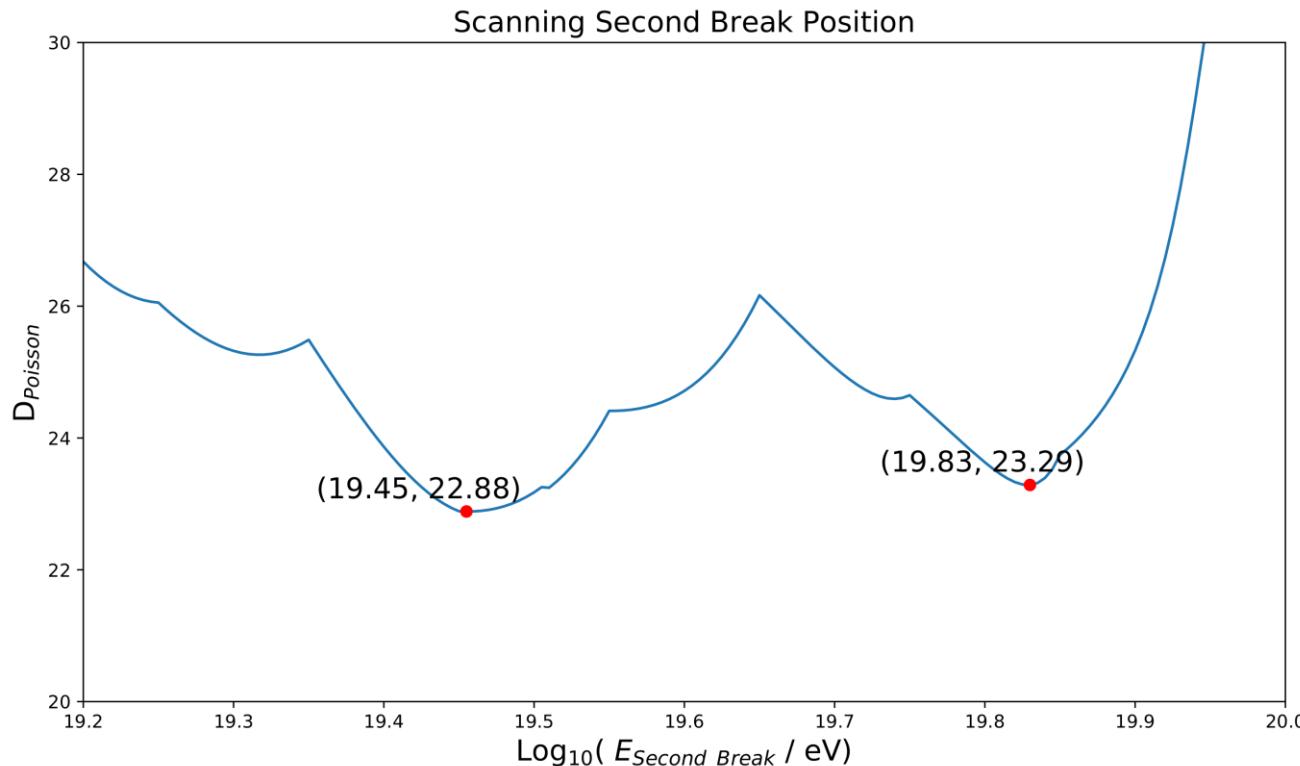

Expected Events

$$N(E_i)_{\text{Expected}} = J(E_i)_{\text{Fit}} \Delta E_i \xi(E)$$

# Twice Broken Power Law Fit Results Compared to Previous Measurements

	This Work, Higher $E_2$	HiRes	TA SD ICRC 2019
